

Amendments to Claims

Claims 1-37 (previously canceled)

- 1 38. (currently amended) A slider having ~~optimized~~ modified crown or camber
2 curvature prepared from substrate material having an air-bearing side and a flex
3 side, prepared by a process using a laser which produces a pulsed laser beam, the
4 process comprising:
5 (A) applying the laser beam to the flex side of the substrate material; and
6 (B) varying the fluence of the laser beam to ~~optimize~~ modify the curvature
7 in the substrate material, and controlling said fluence so that parallel tensile stress
8 cracks are not produced in said substrate material.
- 1 39. (previously presented) A slider prepared by the process of claim 38, wherein
2 fluence is controllably varied by changing the power output of the laser.
- 1 40. (previously presented) A slider prepared by the process of claim 38, wherein
2 fluence is controllably varied by changing the spot size of the laser beam.
- 1 41. (previously presented) A slider prepared by the process of claim 40, wherein
2 the spot size of the laser beam is varied by changing the position of the substrate
3 material relative to the focal plane of the laser beam.
- 1 42. (previously presented) A slider prepared by the process of claim 40, wherein
2 the spot size is controllably varied by changing the position of the focal plane of
3 the laser beam relative to the substrate material.
- 1 43 (previously presented) A slider prepared by the process of claim 42, wherein the
2 focal plane of the laser is moved relative to the substrate material by using at least
3 one focusing lens which is attached to a movable mount.
- 1 44. (previously presented) A slider prepared by the process of claim 38, wherein
2 the laser beam is conditioned with a beam expander that has adjustable beam
3 expansion.
- 1 45. (previously presented) A slider prepared by the process of claim 38, wherein
2 the substrate material is one or more rows of sliders, which are then separated to
3 produce individual sliders.

- 1 46. (new) A slider having modified crown or camber curvature prepared from
- 2 substrate material having an air-bearing side and a flex side, prepared by a process
- 3 using a laser which produces a pulsed laser beam, said slider being free from
- 4 parallel tensile stress cracks produced by said process, the process comprising:
- 5 (A) applying the laser beam to the flex side of the substrate material; and
- 6 (B) varying the fluence of the laser beam to modify the curvature in the
- 7 substrate material.
